

Checklist for adding coliphages to an analytical program

Questions on monitoring objective, matrix, volume, host strain, controls, PFU results and reporting.

Prepared for water microbiology, traceability and product selection conversations.

Monitoring objective

- ☐ Define if the program is screening, routine verification, treatment performance, incident investigation or regulatory preparation.
- ☐ Identify whether the target is somatic coliphages, F-specific coliphages or both.
- ☐ Document how results will trigger review, resampling, escalation or operational action.

Matrix and sampling design

- ☐ List water matrices, sampling points, expected range and seasonality.
- ☐ Confirm sample volume, holding time, transport conditions and acceptance criteria.
- ☐ Define how raw water, treated water, process water or reused water are separated in records.

Method readiness

- ☐ Confirm host strain, culture conditions, positive and negative controls, blanks and replicate strategy.
- ☐ Record batch, media, operator, incubation and reading evidence.
- ☐ Prepare reporting fields for PFU, interpretation, uncertainty notes and technical review.

Suggested next step

Use this checklist to prepare a product, platform, distributor or OEM discussion with AquaVerify.

This document is technical orientation material. Method validation, accreditation, competent authority requirements and the quality system of each organization remain decisive.
